

Vibration Compensation - Vibration Dampening Pipe Seal

WAT-GP.PT pipe seals

Noise and vibration in piping systems can originate from pumps and other mechanical equipment.

WAT-GP.PT pipe seals provide an annular hydrostatic seal for the pipe penetration. The elastomeric seal element of the WAT-GP.PT attenuates vibration and noise transference to the wall structure.

Compression sealing disk expands the seal element, providing a water and gas tight seal at the wall penetration point and a monolithic inner seal isolates and provides an inner seal for the pipe.

The annular disk seal is comprised of an EDPM element seal: (other seal elements are available). The compression plates are made of stainless steel and stainless steel bolting hardware.

Contact Westatlantic with your project, all WAT-GP.PT Seals are application specific.
