

Plug Seals - Tapered Fit - Installation Guide

WA-Plug Seals taper fit pressure tight.

Lubricate the inside of an opening for an easier compression fit.
Use a non-carbon lubricant.

The pipe or conduit must be centered and straight in the opening.
The splits must be aligned to each other, push the tapered plug
into the opening until the flange collar touches.

WA-Plug seal applications may be used for wall seals, plate seals,
deck plate seals, steel tank seals, where pipe, conduit or cable
pass through a wall. They fit small annular spaces between a
pipe and the opening.

Plug seal elastomer materials are EDPM, NBR, Silicone and Viton.
The taper fit allows one plug size to fit and seal several pipe outside
diameters.
