

Westatlantic Tech Corp., split wall sleeves for existing pipes

For all American and International pipe sizes

Split wall sleeves are available with bolt closing flanges or beveled weld closing models. WA-Split pipe sleeves are installed around existing pipes when new concrete walls or slabs are placed across existing pipes or conduit.

The split sleeves protect the existing pipe and provide an annular space for the installation of pipe seals for a complete waterproof penetration of the pipe.

Standard split sleeve lengths are 12 inch long and sized to accommodate the diameter of the existing pipe. Longer sleeves are available. Steel material may be carbon steel, galvanized or 304L stainless.

Split wall sleeves come with two or more puddle flange collars on the sleeve.

Split sleeve assembly includes all materials ready to install, including pipe seals and all closing bolts and gaskets.
